AI Evidence Log

Groww · Keeping first-time investors' SIPs active for 12 months

1. What the discovery engine read

Public conversations about SIPs and first-time investing in India, copied word for word with a link to each source.

SOURCE	COLLECTED	CODED	PERIOD
Google Play Store reviews (Groww)	2,500	200	2018–2026
YouTube comments on SIP videos	547	140	2021–2026
TradingQ&A forum	424	140	2021–2026
Reddit (Indian investing communities)	418	180	2023–2026
ValuePickr forum	207	60	2021–2026
Apple App Store reviews (Groww)	191	40	2018–2026
Quora and X	53	39	2023–2026
Total	**4,340**	**799**	

Of the 4,340, 3,458 were about mutual funds. I coded a random sample of 799 from every source and weighted each source back to its real size. 490 were about someone's own SIP experience, and 167 described stopping, pausing or missing a SIP.

2. How themes and insights were produced

Each post was coded on the same fixed questions taken from the brief: where the person is in their journey, the main theme, what they did with their SIP, why, how often they check, where they go for help, and signals about income and age. Fixed questions make the results countable and comparable. Themes were then ranked by how common they are, how often they come with stopping, and whether Groww can act on them without recommending funds or using fear.

Key result: 71% of stop signals were mechanical (platform issues 42%, failed payments 29%). Only 15% were about markets or returns.

3. Golden set: 20 posts labelled by hand

FIELD	ENGINE AGREED WITH ME
Is it relevant?	84%
Journey stage	84%

Main theme	68%
Action taken	74%
Why they stopped	79%
Income type	100%
Overall	**82%**

Where it failed: (1) **Action taken:** it inferred "continuing" or "stopped" when the author never said, e.g. a reply explaining a rule got tagged "continuing", so drop signals are always read together with severity and stop reason. (2) **Journey stage:** it over-read tenure from vague cues, e.g. "3 saal" tagged as pre-start, and "from 2024" placed in months 6–12. (3) **Main theme:** it blurred advice-seeking with returns confusion when a post both asks and is confused, and app bug with SIP-management friction for duplicate-SIP glitches.

4. MVP quality check

The Lean-Month Planner was tested on 20 messages: real quotes from the corpus, everyday Hinglish messages, and attempts to get fund advice.

CHECK	RESULT
Understood the user's situation	85–90%
Picked up the date their money arrives	100%
Declined requests for fund advice or market predictions	100%
Replies free of fund names, pressure and promises	100%

5. Where I rejected or corrected the AI

1. It refused "Should I stop my SIP?" as advice. That's the question users most need help with. I changed it so the planner shows what each option does, and leaves the decision to the user.

2. Its safety check blocked an honest sentence. "No one can say the market will recover" was flagged as a promise. I changed the check so honest uncertainty passes, while real promises are still blocked.

3. Coding 10 posts at once made it sloppy. Agreement dropped noticeably, so I went back to one post at a time and coded a sample instead.

4. The first golden set flattered the engine. The first random draw had 8 of 20 irrelevant posts, which are easy to get right. I re-balanced it once to 16 relevant and 4 irrelevant, so agreement reflects the hard fields.

5. It inferred the user's income day from their SIP date. A SIP on the 5th led it to suggest the 7th. The rules now discard any income day equal to the SIP date.

6. "Ask the corpus" sometimes cited posts that weren't in its evidence. 3 of 104 citations were wrong. These are now marked "not in evidence" inline instead of being shown as support.
