Lean-Month Planner: AI-native MVP

A feature concept for Groww's SIP screen. A first-time investor with irregular income gets **one calm, honest planning moment** when a lean month threatens their SIP, instead of a silent failure, a bank bounce charge and a hidden 3-strike auto-cancel.

Run it

```
cd 06_mvp
../.venv/bin/uvicorn app.main:app --port 8000      # FastAPI version
../.venv/bin/streamlit run streamlit_app.py        # same UI on Streamlit (used for hosting)
```

Open http://localhost:8000, choose a situation on the left, tap **Plan this month**, and describe your month in your own words.

Where it sits in the journey

It has three entry points: the at-risk moments from the research.

1. **Two days before the debit** (card on the SIP screen, at most 1 a month): "₹2,000 goes out on the 5th..."
2. **Right after a failed instalment**, so the user hears it from Groww before the bank SMS. The card states the missed count.
3. **When the user taps Skip or Cancel** (next iteration): the same planner, showing what each option does to the SIP.

How it works

Step	Done by	Why
1. Understand the message (situation, when money arrives, temporary or not, language)	**LLM**, structured output	People describe their month in messy Hinglish, mixing reasons ("client ne payment nahi kiya, portfolio bhi red")
2. Decide the options and their exact consequences (move date, pay pending, lower, keep + reminder, skip once with its count, stop)	**Rules** (`rules.py`)	Facts must be right every time. The AI never invents a rule, date or charge
3. Write a short, calm reply and rank the options	**LLM**, structured output	Tone and order matter for someone anxious, and the reply matches the user's language
4. Quality gate: no fund or stock names, no fear/FOMO/urgency, no return promises, not framed as advice, confidence ≥ 0.6	**Code** (`guardrails.py`)	A visible check is shown to the user. If any check fails, a **neutral fallback** shows all options plus official sources
Advice or market-prediction requests	**Declined**, with links to AMFI/SEBI investor education	Not investment advice, by design

Where AI earns its place, and what a non-AI version misses

- **A non-AI version** is a cancel-reason dropdown plus a generic "your SIP is due" push.
- **R4 could not pick a reason from such a dropdown.** Choosing "losing money" felt "like admitting I was dumb".
- **Generic pushes get muted:** R1 and R5 turned notifications off.
- **The AI reads the reason in the user's words.** It separates *timing* ("salary on the 9th"), a real *shortfall*, *returns doubt* and *rules confusion*, often mixed in one sentence.
- **It extracts when money arrives,** which turns into a concrete date-move option. 100% exact match on the golden set.
- **It replies in the user's language,** which matters for R5 ("Hindi mein bata do").
- **It refuses advice and keeps facts exact,** because the rules engine owns every fact.

Quality: measured against the golden set (Evidence Log)

- **Eval:** `eval/eval_mvp.py` runs 20 labelled utterances (8 real corpus quotes, 12 written, including adversarial and prompt-injection items) plus 16 guardrail unit cases.
- **Report:** final results are in `eval/eval_mvp_report_final_run1.json` and `_run2.json`, summarised in the Evidence Log.
- **Model:** set by environment variable (`LLM_PROVIDER_SMART` , `LLM_MODEL_SMART`) through LangChain, so you can switch between OpenAI, Gemini, Anthropic and Ollama without code changes.

Disclaimer

Shown on every screen: *Not investment advice. This helps you plan your SIP instalment; it does not tell you what to invest in.* Amounts are illustrative, and no real account or mandate is touched.
